(57)ABSTRACT

An electronic device operable with a radio frequency identification device operable with a detector logic and a method for operating the electronic device with a radio frequency identification device and a detector logic is provided. Firstly, a detection event is registered by the detector logic. The detected event relates to an operation of the radio frequency identification device, which is applicable to transmit data to a counterpart radio frequency identification device. A detection signal is generated and issued by the detector logic in response to the registering and detection event, respectively, which detection signal is received by the electronic device. Then, the electronic device initiates one or more operations in response to the receiving of the detection signal.

Portable CE Device 100
